Date	25 September 2026
Team ID	SWTID-2026-1063
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

DATA FLOW DIAGRAM

External Entity

Incident User

The Incident User creates, updates, and manages Incident records in ServiceNow.

Process 1

1. Create / Update Incident

Input: Incident details

The user enters or updates Incident information such as:

- Short Description
- Description
- Impact
- Urgency
- Assigned To
- State

Output: Incident data

Process 2

2. Apply UI Policy & Client Scripts

This process applies the configured controls to the Incident form.

2.1 UI Policy

High Impact Control

Condition:

Impact = 1 – High

2.2 UI Policy Action

Urgency

- Read-only when Impact is High.
- Reverse when the condition becomes false.

2.3 onChange Client Script

When:

Impact = High

The system automatically sets:

Urgency = High

2.4 onSubmit Client Script

When:

Impact = High and Assigned To is empty

The system prevents the Incident from being submitted and displays an error message.

2.5 onCellEdit Client Script

When the user attempts to change **State** directly from the Incident list, the system blocks the change and asks the user to open the Incident form.

Output: Controlled and validated Incident data

Process 3

3. Validate & Save Incident

The system checks the Incident information according to the configured rules.

If the information is valid:

Incident is saved successfully.

If required information is missing:

Submission is prevented and an error message is displayed.

Output: Valid Incident record

Data Store

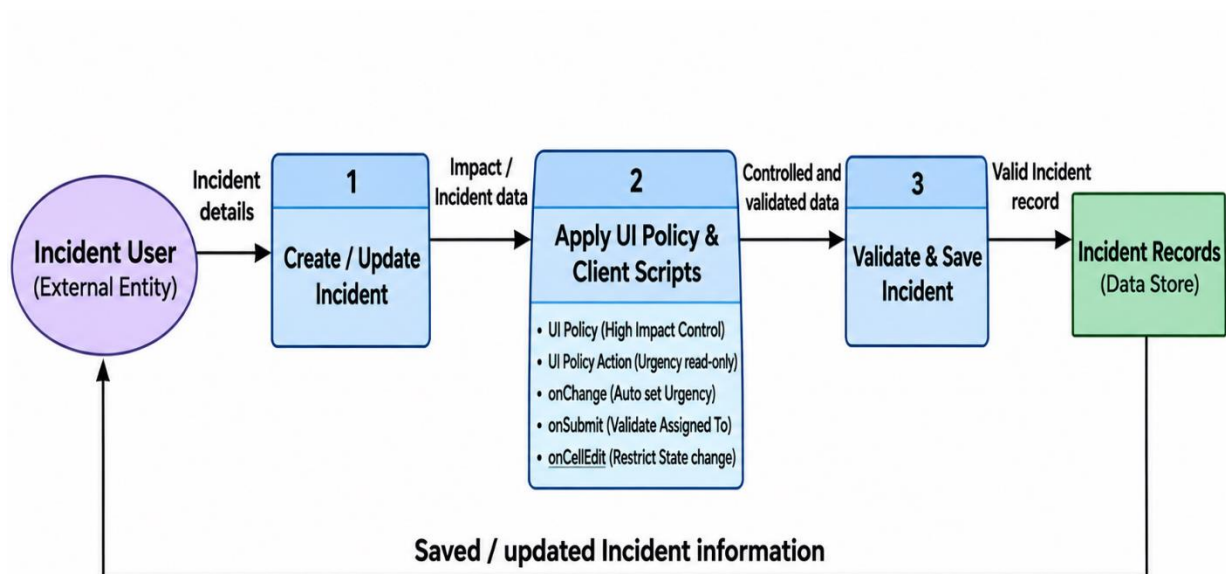

Incident Records

Stores the Incident information after successful validation.

The stored information includes:

- Incident details
- Impact
- Urgency
- Assigned To
- State
- Other Incident information

DFD Diagram

The Data Flow Diagram represents the movement of Incident information through the ServiceNow system. The Incident User enters Incident details through the Incident form. The system applies the configured UI Policy and Client Scripts to control fields, automatically update Urgency, validate Assigned To, and restrict State changes through list editing. The Incident information is then validated and stored as an Incident record when the required conditions are satisfied.
